DESCRIPTION

MEET MANAGEMENT SOFTWARE (MMS) is a PC software application especially designed to work as a management and administration centre and optionally perform installer functions.

The MEET MMS system is a software application with multiple uses which, firstly, permits the installation and commissioning of the system and, secondly, is the ideal tool to manage the installation in terms of security, comfort and communication for the residents.

It performs the following functions:
• Message send to monitors
• Management of alarm warnings and panic calls

It performs configuration functions
• Communication event log
• Access control event log and management
• Alarm event log and configuration
• Face recognition image upload
• Online devices monitoring
• Users and devices database management
• Device configuration push

The MMS is supplied on a USB stick that operates as an encrypted key (dongle). If the security device is not inserted into the PC, the software will not execute.

Only one MMS can be installed in one single project.

The MMS software provides administrator, installer, guard depending on the login entered at the start of the session.

The software can operate with different profiles (LOGINS). Different privileges and operations are associated with the different profiles.
